Interface

- An interface is similar to a class. It can have variables and method signatures; it cannot have any method implementation
- Using interface, **we specify what a class must do, but not how it does this**

```
access interface name {  
    type method-name1(parameter-list);  
    type method-name2(parameter-list);  
    ...  
    final type var-name1 = value1;  
    final type var-nameM = valueM;  
    ...  
}
```

Interface

Interface Implementation

Interface as a Type

Binding

Dynamic Method Lookup

Interface and Abstract Class

Interface Variables

Interface Inheritance

Default Method in Interface

Static Method in Interface

Interface...

- Two types of access:
 - **public** - interface may be used anywhere in a program
 - **default** - interface may be used in the current package only
- **Interface methods have no bodies** - they end with the semicolon after the parameter list. They are essentially abstract methods
- An interface may include variables, but they must be final, static and initialized with a constant value
- *In a public interface, all members are implicitly public*

Default Method in Interface

Static Method in Interface

Interface Implementation

Interface Implementation

- A class implements an interface if it provides a complete set of methods defined by this interface:
 - any number of classes may implement an interface
 - one class may implement any number of interfaces
- Each class is free to determine the details of its implementation
- General format of a class that includes the implements clause:

```
access class className extends superClassClassName  
implements interface1, interface2, ..., interfaceN {  
    ...  
}
```

Access is public or default

Static Method in Interface

Interface Implementation...

Interface Implementation...

- If a class implements several interfaces, they are separated with a comma
- If a class implements two interfaces that declare the same method, the same method will be used by the clients of either interface
- The methods that implement an interface must be declared public
- The type signature of the implementing method must match exactly the type signature specified in the interface definition
- *A class implementing an interface must provide a definition for each method in the interface or itself be declared as abstract*

Static Method in Interface

- Declaration of the *Callback* interface:

```
interface Callback {  
    void callback(int p);  
}
```

- Client* class implements the *Callback* interface:

```
class Client implements Callback {  
    public void callback(int p) {  
        System.out.println("callback called with " + p);  
    }  
  
    void nonIfaceMeth() {  
        System.out.println("Classes that implement " + "interfaces  
may also define " + "other members, too.");  
    }  
}
```

Interface as a Type

- Variable may be declared with interface as its type:

```
interface MyInterface {...}
```

...

```
MyInterface mi;
```

- The variable of an interface type may reference an object of any class that implements this interface:

```
class MyClass implements MyInterface {...}
```

```
MyInterface mi = new MyClass();
```

Interface Inheritance

Default Method in Interface

Static Method in Interface

Interface as a Type...

Interface as a Type...

- Using the interface type variable, we can call any method in the interface:

```
interface MyInterface {  
    void myMethod(...);  
    ...  
}
```

```
class MyClass implements MyInterface {...}  
...  
MyInterface mi = new MyClass();  
...  
mi.myMethod();
```

- The correct version of the method will be called based on the actual instance of the interface being referred to

Interface
Interface Implementation
Interface as a Type
Binding
Dynamic Method Lookup
Interface and Abstract Class
Interface Variables
Interface Inheritance
Default Method in Interface
Static Method in Interface

```
interface Callback {  
    void callback(int p);  
}  
  
class Client implements Callback {  
    public void callback(int p) {  
        System.out.println("callback called with " + p);  
    }  
}  
  
class TestInterface {  
    public static void main(String args[]) {  
        Callback c = new Client();  
        c.callback(42);  
    }  
}
```

Interface as a Type...

- Call through an interface variable is one of the key features of interfaces:
 - the method to be executed is looked up at run-time
 - the calling code can dispatch through an interface without having to know anything about the callee

Interface

Interface Implementation

Interface as a Type

Binding

Dynamic Method Lookup

Interface and Abstract Class

Interface Variables

Interface Inheritance

Default Method in Interface

Static Method in Interface

Interface as a Type...

Interface as a Type...

- Allows classes to be created later than the code that calls methods on them

```
class AnotherClient implements Callback {  
    public void callback(int p) {  
        System.out.println("Another version of callback");  
        System.out.println("p squared is " + (p*p));  
    }    }  
class TestIface2 {  
    public static void main(String args[]) {  
        Callback c = new Client();  
        c.callback(42);  
        AnotherClient ob = new AnotherClient();  
        c = ob;  
        c.callback(42);  
    }    }
```

Binding

- **Compile-Time Method Binding:**

- Normally, in order for a method to be called from one class to another, both classes must be present at compile time
- This implies:
 - a static, non-extensible classing environment
 - functionality gets pushed higher and higher in the class hierarchy to make them available to more sub-classes

- **Run-Time Method Binding:**

- Interfaces support dynamic method binding
- Interface disconnects the method definition from the inheritance hierarchy:
 - interfaces are in a different hierarchy from classes
 - it is possible for classes that are unrelated in terms of the class hierarchy to implement the same interface

Interface Variables

Interface Inheritance

Default Method in Interface

Static Method in Interface

Dynamic Method Lookup

- It is a process that determines which method definition to use for a method signature at runtime, based on the type of the object
- Polymorphism and dynamic method lookup form a powerful programming paradigm that simplifies client definitions, encourages object decoupling, and supports dynamically changing relationships between objects at runtime

Interface

Static Method in
Interface

Interface and Abstract Class

- A class that claims to implement an interface but does not implement all its methods must be declared **abstract**

```
interface Callback {  
    void callback(int p);  
}
```

```
abstract class Incomplete implements Callback {  
    int a, b;  
    void show() {  
        System.out.println(a + " " + b);  
    }  
}
```

Interface Variables

- *Variables declared in an interface must be constants*
- A technique to import shared constants into multiple classes:
 - declare an interface with variables initialized to the desired values
 - include that interface in a class through implementation
- As no methods are included in the interface, the class does not implement anything except importing the variables as constants

Interface

Static Method in Interface

```
import java.util.Random;  
  
interface SharedConstants {  
    int NO = 0;  
    int YES = 1;  
    int MAYBE = 2;  
    int LATER = 3;  
    int SOON = 4;  
    int NEVER = 5;  
}  
  
class Question implements SharedConstants {  
    Random rand = new Random();  
    int ask() {  
        int prob = (int) (100 * rand.nextDouble());  
        if (prob < 30) return NO;  
        else if (prob < 60) return YES;  
        else if (prob < 75) return LATER;  
        else if (prob < 98) return SOON;  
        else return NEVER;  
    }  
}
```

Interface Inheritance

Interface Inheritance

- One interface may inherit another interface

```
interface MyInterface1 {  
    void myMethod1(...);  
}
```

```
interface MyInterface2 extends MyInterface1 {  
    void myMethod2(...);  
}
```

- **When a class implements an interface that inherits another interface, it must provide implementations for all methods defined within the interface inheritance chain**

```
class MyClass implements MyInterface2 {  
    void myMethod1(...) {...}  
    void myMethod2(...) {...}  
    ...  
}
```

Default Method in Interface

Since Java 8, we can have default method in interface

```
interface Drawable{  
    void draw();  
    default void msg(){  
        System.out.println("default method");  
    }  
}  
  
class Rectangle implements Drawable{  
    public void draw(){  
        System.out.println("drawing rectangle");  
    }  
}  
  
class Test{  
    public static void main(String args[]){  
        Drawable d=new Rectangle();  
        d.draw();  
        d.msg();  
    }  
}
```

Static Method in Interface

Since Java 8, we can have static method in interface

```
interface Drawable{  
    void draw();  
    static int cube(int x){  
        return x*x*x;  
    }  
}  
  
class Rectangle implements Drawable{  
    public void draw(){  
        System.out.println("drawing rectangle");  
    }  
}  
  
class Test{  
    public static void main(String args[]){  
        Drawable d=new Rectangle();  
        d.draw();  
        System.out.println(Drawable(cube(3));  
    }  
}
```
